

<p>STANDARD SECTOR INDICATOR CODE: AG-018</p>	<p>Households Maintaining Garden One Year: Number of households, out of total number visited/advised by Volunteer/partner, who maintained a garden for at least one year. (AG-018)</p>	
<p>AGRICULTURE SECTOR</p>	<p>Sector Schematic Alignment <i>Note: This indicator belongs to the “Productivity” Project area and “Gardens” Project Activities/Training Package (PA/TP) within the AG Sector but is borrowed by the following Project Activities/Training Packages within the AG and ENV Sectors.</i></p> <p><u>AG Sector (“Home” of the SI)</u> PA/TP: Gardens</p> <p><u>AG Sector</u> PA/TP: Gardens</p> <p><u>ENV Sector</u> PA/TP: Agroforestry, Gardens</p>	
<p>Type: Outcome</p>	<p>Unit of Measure: Household</p>	<p>Disaggregation: Gendered Household type: Adult Female no Adult Male (FNM), Adult Male no Adult Female (MNF), Male and Female Adults (M&F), Child No Adults (CNA)</p>
<p>Definitions:</p> <p>Gardens—can be defined as areas cultivated specifically for production of horticultural crops, which can be either annual or perennial plants. Horticultural garden crops include food (fruits, vegetables, mushrooms, culinary herbs) and non-food crops (flowers, trees and shrubs, medicinal herbs, etc.). Gardens are typically intensively managed areas, perhaps receiving supplemental water through irrigation, and producing food for multiple seasons.</p> <p>Source: http://en.wikipedia.org/wiki/Horticulture</p> <p>Partner/s—refers to the local counterpart who is co-facilitating garden maintenance activities with the Volunteer.</p> <p>Rationale: Recording the number of gardens operating one year after establishment is a more reliable indicator of program success than counting how many gardens have been established, because a percentage of new gardens may not be producing food for very long.</p>		
<p>Measurement Notes:</p> <ol style="list-style-type: none"> Sample Tools and/or Possible Methods (for Peace Corps staff use): Volunteers should use data collection tools to measure progress against project indicators. A data collection tool to measure this indicator could be based on one of the following methods—survey, observation, interviews, or community mapping—though there may be other data collection methods that are appropriate as well. For more information on the suggested methods, please see Appendix I in the MRE Toolkit. Also be sure to check the intranet page as sample tools are regularly uploaded for post use. Once a tool has been developed, post staff should have a few Volunteers and their 		

partners pilot it, and then distribute and train Volunteers on its use.

2. **General Data Collection for Volunteer Activities:** All Volunteer activities should be conducted with the intention of achieving outcomes – knowledge change (short-term), skills demonstration (intermediate-term), and behavioral changes (intermediate to long term) as defined by the progression of indicators within the objectives of a project framework. The progression of measurement for all Volunteer activities should begin with baseline data being conducted prior to the implementation of an activity (or set of activities), followed by documenting any outputs of the activities and then later at the appropriate time, measurements of specific outcomes (see “Frequency of Measurement”).
3. **Activity-Level Baseline Data Collection:** Activity-level baseline data should be collected by Volunteers/partners before or at the start of their activities with a household or group of households. It provides a basis for planning and/or assessing subsequent progress or impact with these same people. Volunteers should take a baseline measurement regarding the outcome(s) defined in this indicator (i.e. determine whether or not a household in question has maintained a garden for at least a year before working with the Volunteer) early in their work focused on household gardens. The information for the baseline measurement will be the same or very similar to the information that will be collected in the follow-on measurement (see “Frequency of Measurement”) after the Volunteer has conducted his/her activities and it is usually collected using the same data collection tool to allow for easy management of the data over time.

Because Volunteers are expected to implement relevant and focused activities that will promote specific changes within a target population (see the “unit of measure” above), taking a baseline measurement helps Volunteers to develop a more realistic snapshot of where households within the target population are in their process of change instead of assuming that they are starting at “0.” It also sets up Volunteers to be able to see in concrete terms what influence their work is having on the households they work with during their service. Please note that data collection is a sensitive process and so Volunteers will not want to take a baseline measurement until they have been able to do some relationship and trust-building with the people and households the Volunteer is working with, and developed an understanding of cultural norms and gender dynamics.

4. **Frequency of Measurement:** For reporting accurately on this outcome indicator, Volunteers must take a minimum of two measurements with households of the target population reached with their activities. After taking the baseline measurement (described above), Volunteers should take at least one follow-on measurement with the same household(s), typically after completing one or more activities focused on achieving the outcome in this indicator and once they have determined that the timing is appropriate to expect that the outcome has been achieved. Please note that successful documentation of a behavior change or new practice may not be immediately apparent following the completion of activities and may need to be planned for at a later time. Once Volunteers have measured that at least one household has achieved the indicator, they should report on it in their next VRF.

Volunteers may determine to take more than one baseline and one follow-on measurement with the same households (or group of households) for the following valid reasons:

- a. Volunteers may want to measure whether or not any additional households initially reached with activities have now achieved the outcome in the indicator, particularly for any activities that are on-going in nature (no clear end date);
- b. Volunteers may want to enhance their own learning and the implementation of their activities by using the data collected as an effective monitoring tool and feedback mechanism for the need to improve or increase their activities;

- c. A Peace Corps project in a particular country may choose to increase the frequency of measurement of the indicator and Volunteers assigned to that project will be required to follow in-country guidance.

In all cases, any additional data collection above the minimum expectation should be based on the time, resources, accessibility to the target population, and the value to be gained versus the burden of collecting the data. Following any additional measurements taken, Volunteers should report on any new households achieving the outcome in their next VRF.

5. **Definition of Change:** The minimum change to report against this indicator is a household maintaining a garden for one year as compared to what was measured initially at baseline. In the case of this indicator, if the household the Volunteer/partner works with has been maintaining a small herb garden for at least a year, then the Volunteer would not be able to count it for this activity because the Volunteer's work did not actually lead to the desired change. However, if as a result of working with the Volunteer/partner, the household decided to establish and maintain a backyard kitchen garden for at least a year, which would count because the Volunteer's work influenced the establishment and maintenance of the backyard kitchen garden for one year.
6. **General Reporting in the VRF:** The "number achieved" (or numerator), that Volunteers will report against this indicator in their VRFs is the number of households who maintained a garden for at least a year, after working with the Volunteer/partner. The "total number" (or denominator) that Volunteers will report on for this indicator in their VRFs is the total number of households whom the Volunteer/partner reached while implementing the activity/ies being reported.
7. **Reporting on Disaggregated Data in the VRF:** This indicator is disaggregated by "Gendered Household Type". When reporting in the VRF, a Volunteer should disaggregate the households who achieved the outcome based on Adult Female no Adult Male (FNM), Adult Male no Adult Female (MNF), Male and Female Adults (M&F), Child No Adults (CNA).

Data Quality Assessments (DQA): DQAs are needed for each indicator selected to align with the project objectives. DQAs review the validity, integrity, precision, reliability, and timeliness of each indicator. For more information, consult the Peace Corps MRE toolkit.
