Introduction

The Health of the Volunteer is an annual report produced by the Epidemiology and Surveillance Unit of Peace Corps' Office of Medical Services (OMS). This report provides information on health conditions experienced by Peace Corps Volunteers, Peace Corps Response Volunteers, and trainees during the calendar year and is intended for use by Peace Corps medical officers (PCMOs), Volunteers, and agency staff.

The Health of the Volunteer 2010 reflects OMS' mission to monitor and evaluate trends in global and regional health conditions among Peace Corps Volunteers and trainees. This volume includes 2010 highlights, along with details reflecting each reported condition and event. Appendices have extended figures, tables, and country-specific data.

The report is designed to facilitate the education and training of Volunteers and staff and to help enhance prevention efforts. This volume, additional tables, and previous reports may be accessed via the Peace Corps Intranet on the Epidemiology page.

Data Methods

Data Sources

Information used to prepare this report came from PCMOs through monthly Epidemiologic Surveillance System (ESS) reports (Appendix A). Accommodation data were collected by the OMS Pre-Service Unit. Post-service claims data were provided through the OMS Post-Service Unit. Information on mental health consultations was collected by the Counseling and Outreach Unit (COU) in the Office of Volunteer Support (OVS).

Throughout this document the term "Volunteer" includes Peace Corps Volunteers and trainees, as well as Peace Corps Response Volunteers.

Data Analysis

Incidence Rates

Incidence is the number of new cases of a disease or condition. Incidence rate is the proportion of new cases within the population at risk.

In *The Health of the Volunteer*, incidence rates are expressed per 100 Volunteer years (VT years). These rates are calculated by dividing the number of new

cases of disease in a year by the VT year count and then multiplying by 100.

$$\text{Rate in VT years} = \left(\frac{\text{Number of new cases of disease}}{\sum (\text{Time each Volunteer served in years})} \right) \times 100$$

Volunteer Years

Volunteer years (VT years) take into account both the number of Volunteers and the length of time each Volunteer served. Since Volunteers may serve less than a full calendar year, counting VT years is more accurate than counting individual Volunteers.

Female Volunteer Years

Rates for pregnancy, gynecological infections, and colposcopies are given per 100 female VT years. Since these conditions affect only females, male Volunteers have been excluded from the denominator in these calculations.

Malaria Volunteer Years

Rates for malaria (by type), malaria (by prophylaxis), and average monthly antimalaria chemoprophylaxis are given per 100 malaria VT years. Since these conditions only affect Volunteers in countries with endemic malaria, Volunteers serving in nonmalarial countries have been excluded from the denominator in these calculations.

Trend Lines

Figures that show incidence rates over time display trend lines to emphasize tendencies in data direction. Commencing in 2007, trend lines were tested for joins or places where the data trends show a significant direction change.

Trendlines were created using Joinpoint, a program freely available from the National Cancer Institute. Information on this method is available at <http://srab.cancer.gov/joinpoint>.

Data Limitations

There are several limitations to the information presented in this report. If Volunteers do not seek health care from the PCMO, the number of reported cases may not reflect the actual burden of disease.

Not all conditions can be precisely confirmed, so some reported cases may be misclassified.

Incidence rates based on small numbers of cases (20 or less) should be interpreted with caution since a change of a few cases can produce a large change in rate. Most country-specific rates fall into this category. In the figures provided, counts are given instead of rates when the number of cases in one or more categories is less than 20.

2010 Changes

Changes to Peace Corps Countries

Peace Corps served in 69 posts in 2010 (Appendix B). During the year, three posts were opened: Indonesia in April, Sierra Leone in July, and Colombia in October. One post (Guinea) was re-opened in September.

Programs that close during the calendar year provide data only for the months during which they were operational. Incidence data for these posts should be interpreted cautiously.

Changes to Peace Corps Units

The Office of Special Services was officially renamed the Counseling and Outreach Unit to better reflect the range of services provided by staff in the Unit.

Changes to The Health of the Volunteer Report

Commencing with *The Health of the Volunteer 2010* report, information on the number of pre-service accommodations by country has been included in Appendix D.

Pre-Service Accommodations

The Medical Accommodation Program within OMS is designed to facilitate the decision-making process regarding applicants with special medical or site placement needs. The Pre-Service Unit and/or the Medical Placement Coordinator review all applicants who need special medical and/or site placement. Applicants with conditions that require special medical monitoring (*i.e.*, beyond routine care), are cleared by the Screening Team for countrywide service in countries that can support such monitoring. Applicants with conditions that require a specific geographic location or require proximity to an urgent care medical facility are cleared for site-specific

service by the Medical Placement Coordinator. This process may include consultation between the OMS, the Office of Volunteer Recruitment and Selection and Peace Corps post staff.

Feedback

Comments on the content of this report and suggestions to enhance its usefulness, especially as a training tool for Volunteers, are encouraged. Please direct feedback to Dr. Myrna Charles in the Epidemiology and Surveillance Unit at mcharles@peacecorps.gov or 202.692.1517.

2010 Highlights

Notable

Increase in Dengue Rates (Page 6)

Reported cases of dengue in 2010 were greater than the average number of cases per year reported during 2001-2009 (mean: 96 cases). One hundred and thirty-eight cases of dengue were reported in 2010 for a rate of 1.8 cases per 100 VT years. This represents a 29 percent rise in dengue infections from the previous year.

Changes in asthma rates in IAP and Africa (Page 14)

From 2009 to 2010, the asthma rate among Volunteers in the IAP region increased by 40 percent, from 2.5 to 3.5 per 100 VT years (60 to 90 cases). Costa Rica, Honduras, Nicaragua, and Paraguay reported significant increases in the number of Volunteers treated for asthma.

From 2009 to 2010, the Africa region reported a 50 percent decrease in the asthma rate among Volunteers, from 2.0 to 1.0 per 100 VT years (56 to 29 cases). EMA had no change in cases.

Increase in Mental Health Issues (Page 17)

The rate of mental health issues in 2010 was 18.1 mental health issues per 100 VT years. This represents an increase since 2009 (15.8 cases per 100 VT years). The highest incidence of mental health issues occurred in the EMA region (20.3 cases per 100 VT years), followed by Africa (18.8) and IAP (15.3).

Increase in Malaria rates in Africa (Page 10)

From 2009 to 2010, reports of malaria cases increased by 26 percent, from a rate of 5.4 to 6.8 cases per 100 VT years (145 to 189 reported cases.) Six countries in Africa accounted for 71 percent of the reported cases. IAP had no change in its rate of malaria.

Increase in In-Country Hospitalizations (page 19)

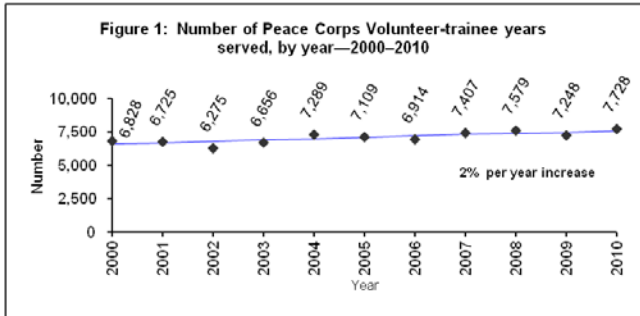

In 2010, the rate of in-country hospitalizations for Volunteers was 4.8 hospitalizations per 100 VT years.

The EMA region reported an increase in the rate of in-country hospitalizations since 2009, from 2.4 to 4.0 hospitalized cases per 100 VT years (51 to 93 cases) in 2010.

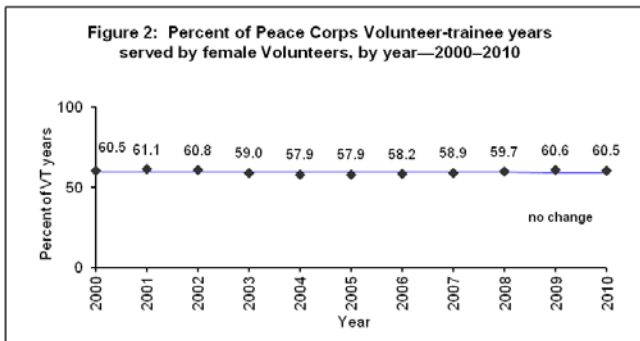

2010 Results

Volunteer demographics

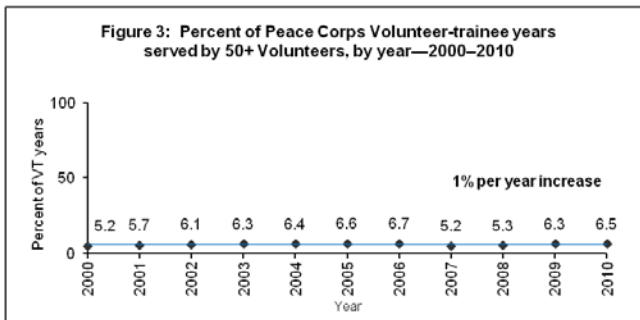

In 2010, Peace Corps Volunteers, trainees, and Peace Corps Response Volunteers served a total of 7,728 Volunteer-trainee years (VT years). The overall number of VT years has increased an average of 2 percent per year.

Female Volunteers served 4,678 VT years, accounting for over half of the total VT years served (60.5 percent). The proportion of VT years served by females has remained relatively constant since 1999.

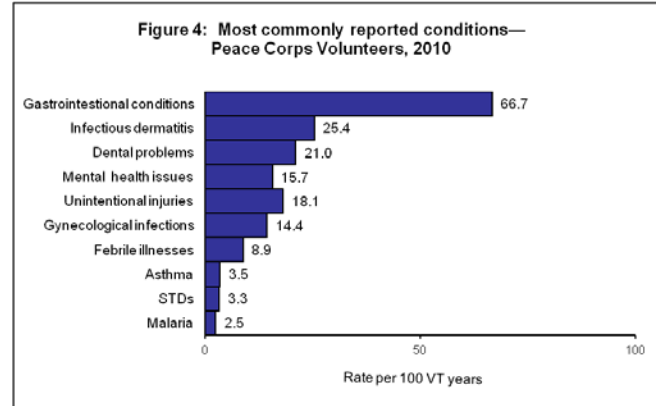

Volunteers age 50 years and over served 499 VT years in 2010, 6.5 percent of the total VT years served. The proportion of VT years served by Volunteers 50 years of age and over has increased an average of 1 percent per year.

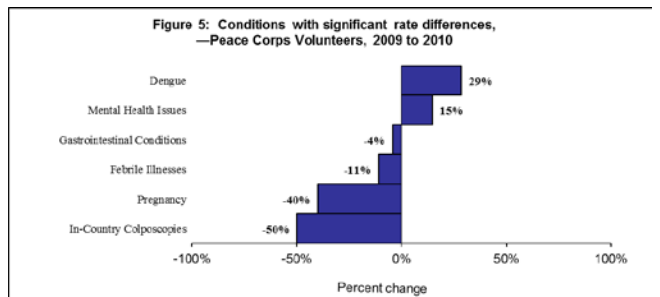

Most common conditions

As seen in previous years, the three most commonly reported conditions included gastrointestinal illness, infectious dermatitis, and dental problems. Gastrointestinal conditions remained the most reported condition, with 66.7 cases per 100 VT years, while infectious dermatitis ranked second, with a rate of 25.4 cases reported per 100 VT years.

Conditions with significant rate differences

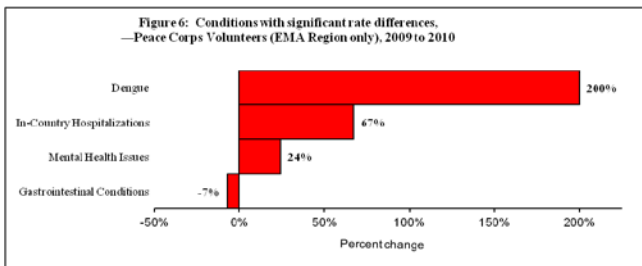

Worldwide, six conditions had statistically significant differences in rate from 2009 to 2010 (p-value <0.05). Dengue and mental health issues had significant rate increases during this time period, increasing 29 percent, from 1.4 to 1.8 cases per 100 VT years (101 to 138 cases), and 15 percent, from 15.8 to 18.1 per 100 VT years (1,142 to 1,399 cases), respectively.

Gastrointestinal conditions, febrile illnesses, pregnancy, and colposcopies performed in-country saw a significant decrease in incidence rates from 2009 to 2010.

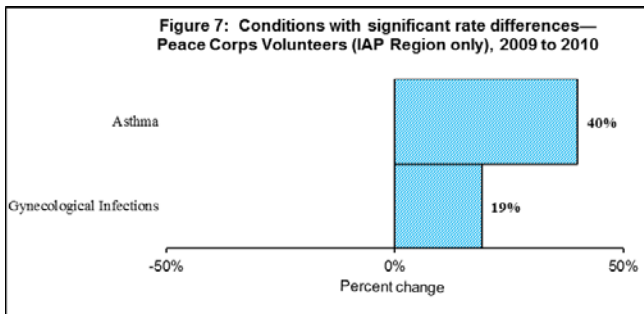

In EMA, from 2009 to 2010, the rate of dengue infections increased by 200 percent, from 0.5 to 1.5 cases per 100 VT years (11 to 35 cases). During this period, the rate of in-country hospitalizations increased 67 percent, from 2.4 to 4.0 (51 to 93 hospitalizations). This increase was mainly caused by an increase in the number of Volunteers needing

hospitalization in the Philippines. There was a significant decrease in the number of gastrointestinal conditions reported in the EMA region as depicted in the graph below.

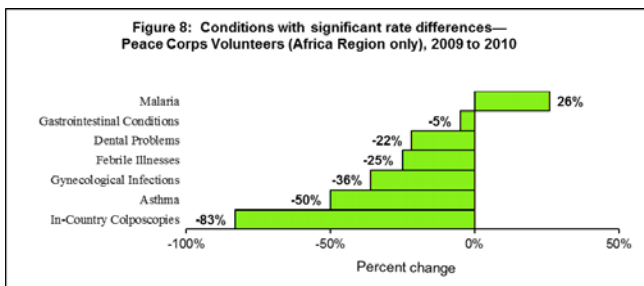

An increase in the rate of mental health issues was seen in EMA but not the other regions, with a rate increase of 24 percent, from 16.4 to 20.3 (343 to 470 cases) per 100 VT years. This increase was seen predominantly in the Kyrgyz Republic.

In 2010, the IAP regional rate of asthma increased 40 percent, from 2.5 to 3.5 cases per 100 VT years (60 to 90 cases.) There was also an increase in the incidence of gynecological infections, from 19.2 to 22.8 cases per 100 VT years (275 to 355 cases).

The Africa region had significant rate decreases in many conditions from 2009 to 2010. The rate of asthma decreased from 2.0 to 1.0 cases per 100 VT years (56 to 29 cases), while in-country colposcopies decreased by 83 percent, from 0.6 to 0.1 (16 to two procedures).

An increase in the rate of malaria cases was seen only in the Africa region, with a rate increase from 5.4 to 6.8 cases per 100 VT years (145 to 189 cases.)

Some conditions with significant rate differences appeared in multiple regions. The incidence of gastrointestinal conditions decreased in EMA and Africa. Asthma and gynecological infections decreased in Africa while increasing in IAP.

Infectious Conditions

Dengue

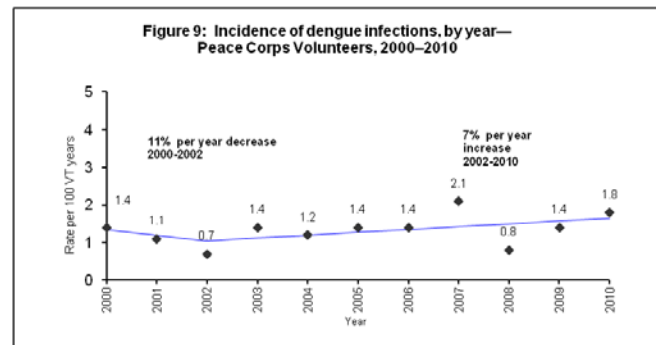

Dengue is a viral disease transmitted to humans by infected mosquitoes. Symptoms include high fever, severe headache, and joint and muscle pain. Dengue Hemorrhagic Fever (DHF) is a severe form of dengue that causes internal bleeding.

According to the World Health Organization, the incidence of dengue cases is increasing globally as the disease spreads to new areas. Large outbreaks of dengue occur every few years in tropical countries.

In 2010, the number of dengue cases reported was greater than the average number of cases reported per year during 2001-2009 (mean: 96 cases). One hundred and thirty-eight cases of dengue were reported in 2010 for a rate of 1.8 cases per 100 VT years. This represents a 29 percent rise in dengue infections from the previous year.

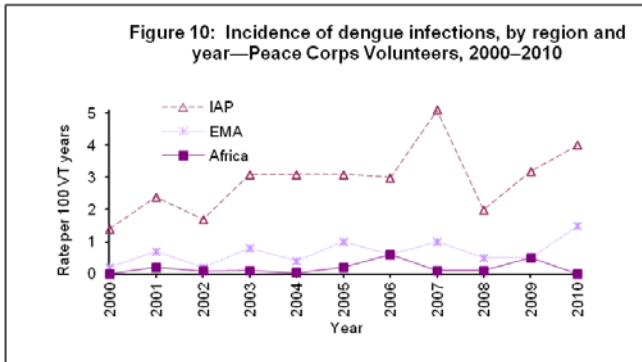

Cases were reported from 14 countries in the IAP region, four countries in EMA and one country in Africa. A significant increase in cases was seen in Cambodia, Honduras, Nicaragua, and the Philippines. In 2010, most of the reported dengue cases were from Nicaragua.

From 2000 to 2002, there was an 11 percent per year decrease in dengue cases among Volunteers. Since 2002, dengue rates have increased by an average of 7 percent per year.

Dengue infection is found in the tropics and subtropics. The IAP region routinely accounts for the greatest number of cases among Volunteers. IAP

reported 102 (74 percent) of the 138 cases seen in 2010, with an increase in incidence rate, from 2009, of 3.2 to 4.0 cases per 100 VT years. This compared to EMA, with 35 cases (25 percent) and an incidence rate of 1.5 cases per 100 VT years, and Africa, which had a decrease in rate to 0.01 cases per 100 VT years and had 1 (0.07 percent) of the cases.

Dermatitis, infectious

As in 2009, the second most commonly reported condition among Volunteers in 2010 was infectious dermatitis, with a rate of 25.4 cases per 100 VT years (1,961 cases).

Infectious dermatitis includes any infection of the skin by bacterial, fungal or parasitic organisms. These conditions may or may not be laboratory-confirmed. Noninfectious skin conditions such as acne, eczema, or non-specific rashes were not included.

From 2000 to 2004, the rates of infectious dermatitis increased by 5 percent per year and then decreased by 6 percent per year from 2004 to 2010.

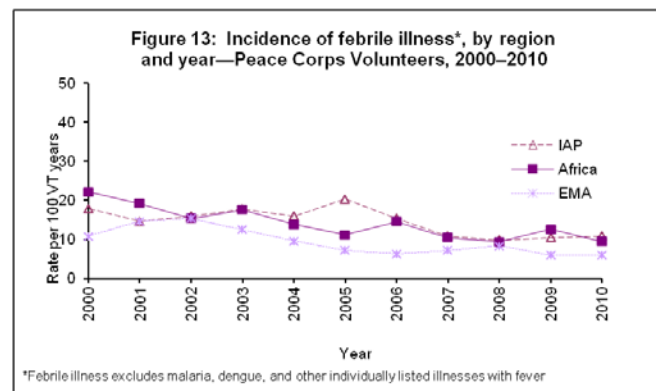

Febrile illness, other

Other febrile illnesses had a rate of 8.9 cases per 100 VT years (687 cases) in 2010. Reports of febrile illness have decreased 5 percent per year since 2000.

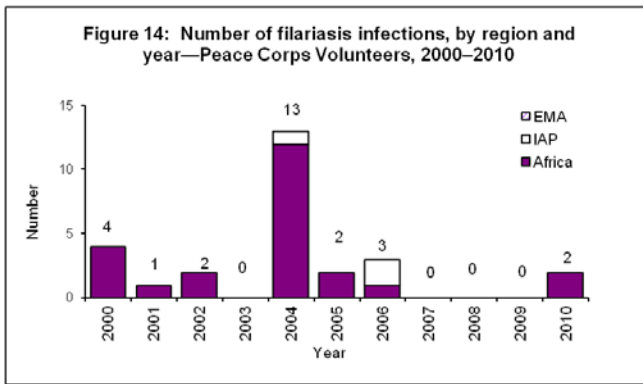

In 2010, rates in Africa declined, while a slight increase has been seen in IAP since 2009, from 10.5 to 10.9 cases per 100 VT years (249 to 278 cases).

Filariasis

Filariasis is a group of parasitic diseases caused by microscopic, threadlike worms. Lymphatic filariasis is contracted through the bite of an infected mosquito and can cause swelling (lymphedema), as well as thickening, hardening, and disfiguration of the skin (elephantiasis), usually affecting the limbs, breasts, and genitals. Onchocerciasis (river blindness) is contracted through the bite of an infected black fly and can cause inflammation, while chronic infection can produce blindness. *Loa loa*, or African eye worm, is contracted through the bite of an infected horsefly and can cause lymphedema, itching, inflammation, and migration of worms through the eyeballs.

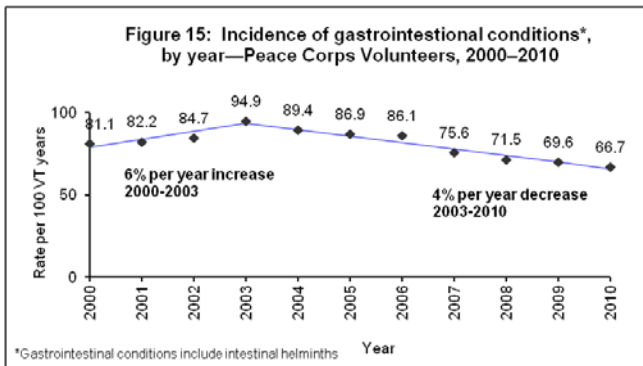

There were two cases of filariasis reported among Volunteers in the Africa region in 2010. This category includes lymphatic filariasis, onchocerciasis, and *loa loa*.

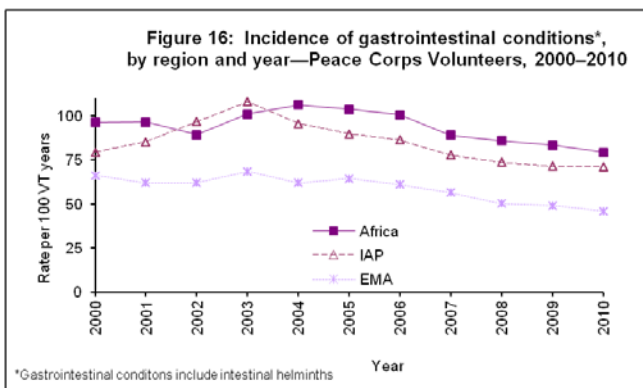

Gastrointestinal conditions

Gastrointestinal conditions include laboratory confirmed and non-laboratory confirmed illnesses with four or more liquid or watery stools per day.

This category continues to lead reportable condition categories, with a rate of 66.7 cases per 100 VT years (5,152 cases). From 2000 to 2003, the rate of gastrointestinal conditions increased 6 percent per year and then from 2003 to 2010 the rate decreased by an average of 4 percent per year.

A statistically significant decrease in rates of gastrointestinal conditions was seen among Volunteers in the EMA and Africa regions.

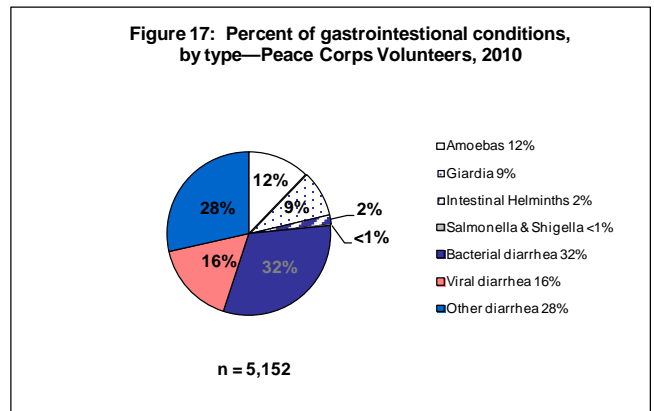

“Bacterial diarrhea, other or presumed” captures infections of the gastrointestinal tract confirmed by laboratory testing or with a clinical presentation consistent with bacterial infection in which antibiotic treatment was administered but etiology was not lab-confirmed. The bacterial agents are those that do not apply to other ESS categories (e.g., amebiasis, giardiasis, salmonellosis, or shigellosis).

“Viral diarrhea, other or presumed” includes infections of the gastrointestinal tract due to a viral species confirmed by laboratory testing or a clinical presentation consistent with viral infection that is not confirmed by laboratory testing.

Among the 5,152 gastrointestinal conditions reported in 2010, 32 percent were of bacterial etiology, 16 percent were of viral origin, 12 percent were amebiasis, 9 percent giardiasis, 2 percent intestinal helminths, 0.1 percent salmonellosis, and 0.1 percent shigellosis. The remaining 28 percent of cases were classified as “other diarrhea.”

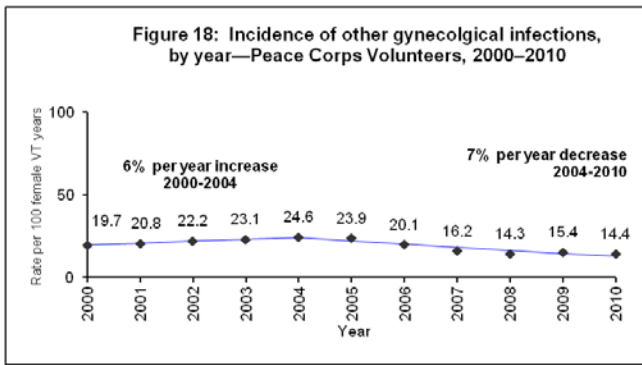

“Other diarrhea” represents gastrointestinal tract infections caused by parasites not identified in the categories above, noninfectious causes (e.g., heavy metals, chemicals, food allergies, medications), or an unknown etiology.

Gynecological infections, other

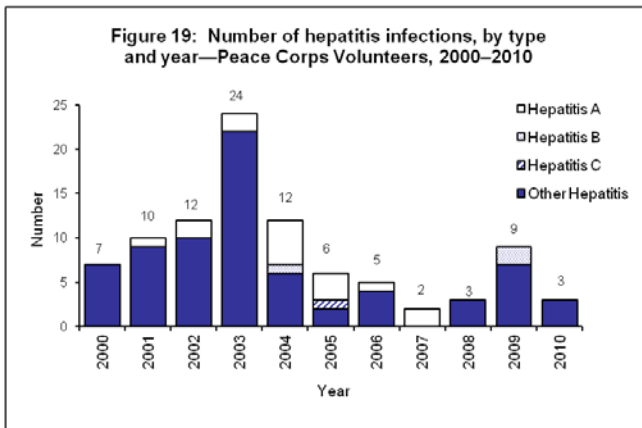

Other gynecological infections include bacterial vaginosis, vaginal yeast infection, and pelvic inflammatory disease.

There were 673 other gynecological infections reported in 2010 for a rate of 14.4 cases per 100 female VT years. This rate increased an average of 6 percent per year from 2000 to 2004 and decreased 7 percent per year from 2004 to 2010.

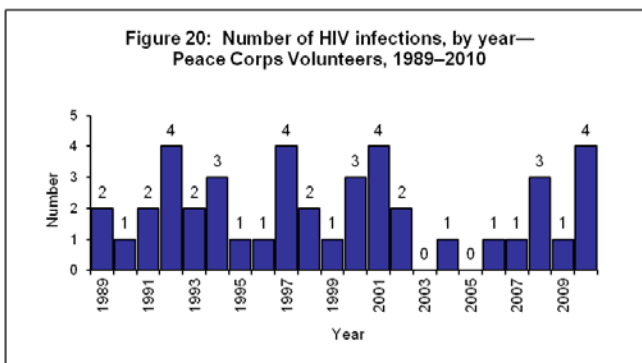

Hepatitis

There were three cases of hepatitis reported among Volunteers in 2010. All the cases were in the “Hepatitis, Other or Presumed” category. This category includes hepatitis E and presumed hepatitis, as well as infectious and noninfectious causes of elevated amino-transferase levels.

Human Immunodeficiency Virus

In 2010, four Volunteers tested positive for human immunodeficiency virus (HIV) infection.

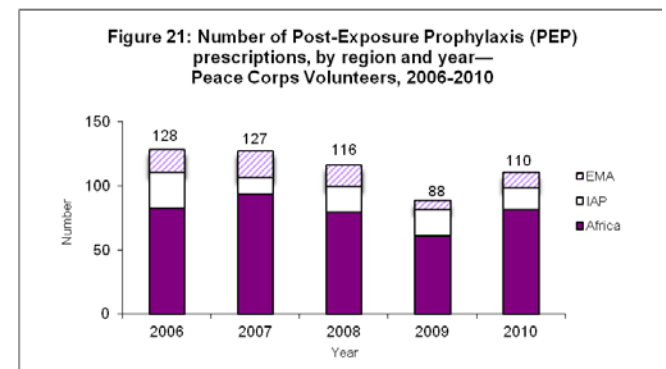

Peace Corps initiated HIV screening in 1987. Volunteers have been screened both prior to, and at the end of, service since 1989. Since 1989, 43

Volunteers have tested positive for HIV during service.

Post-exposure prophylaxis

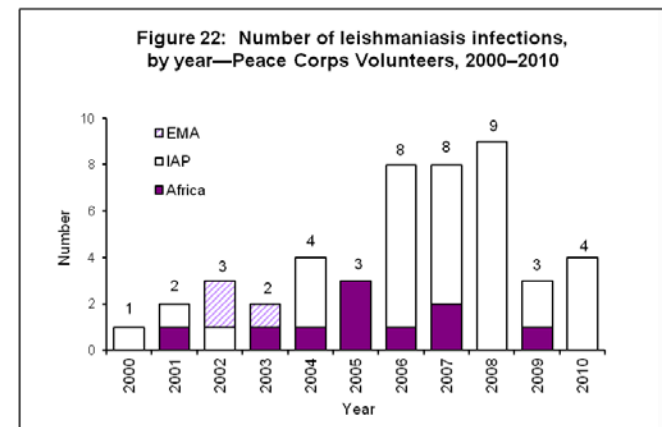

HIV post-exposure prophylaxis (PEP) was prescribed to 110 Volunteers for a rate of 4.0 prescriptions per 100 VT years in 2010. The majority of PEP (74 percent; 81 cases) was prescribed in Africa. The rate of PEP in Africa increased from 2009 to 2010 (2.2 to 2.8 prescriptions per 100 VT years; 61 to 81 cases). The PEP prescription rate in EMA increased 67 percent during this period (0.3 to 0.5 prescriptions per 100 VT years; 7 to 12 cases). In IAP, the rate of PEP prescriptions decreased from 2009 to 2010 (0.8 to 0.7 prescriptions per 100 VT years; 20 to 17 cases).

PEP has been available since 1997 to Volunteers potentially exposed to HIV. Data on PEP use was first collected in 2006.

Leishmaniasis

Leishmaniasis is a parasitic disease spread to humans through the bite of infected sand flies. The two most common forms are cutaneous, which produces skin sores, and visceral, which affects internal organs such as the spleen, liver, and bone marrow.

There were four cases of leishmaniasis reported among Volunteers in 2010; all cases were in Panama.

Malaria

The overall rate of malaria among Volunteers was 2.5 cases per 100 VT years in 2010 (194 cases).

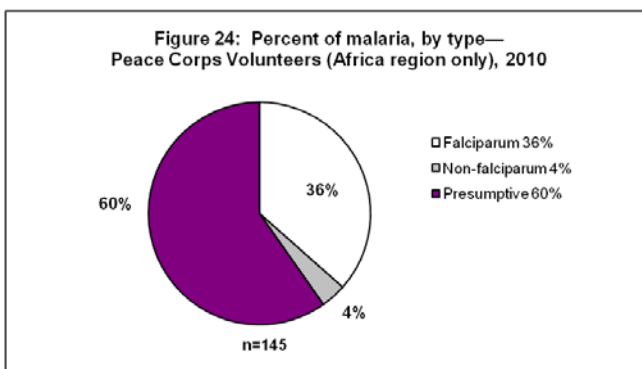

This rate has decreased an average of 5 percent per year since 2000.

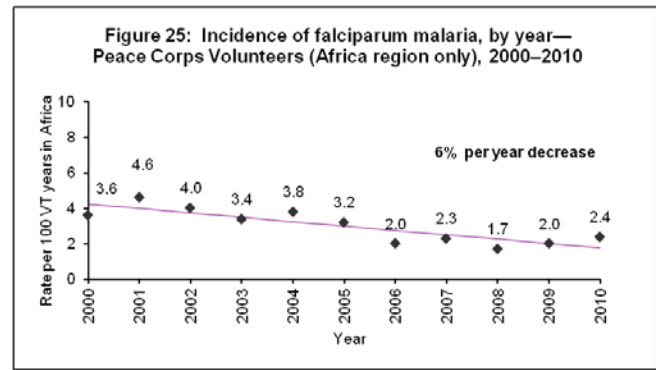

Regionally, Africa saw the most malaria (97 percent; 189 cases). This represents a significant increase in cases since 2009 (97 percent; 145 cases). Twenty countries in Africa reported malaria cases; however, six countries (Benin, Cameroon, Ghana, Mali, Uganda, and Zambia) accounted for 71 percent (135 cases).

Five cases of malaria were reported from IAP, three non-falciparum and one case of falciparum malaria.

Of the 189 malaria infections among Africa Volunteers, 36 percent (69 cases) were confirmed *Plasmodium falciparum*, 60 percent (113 cases) were presumptive malaria, and 4 percent (7 cases) were confirmed as non-*Plasmodium falciparum* species.

The rate of falciparum malaria in Africa was 2.4 per 100 VT years in 2010 (69 cases). This rate has decreased an average of 6 percent per year since 2000.

Antimalarial chemoprophylaxis

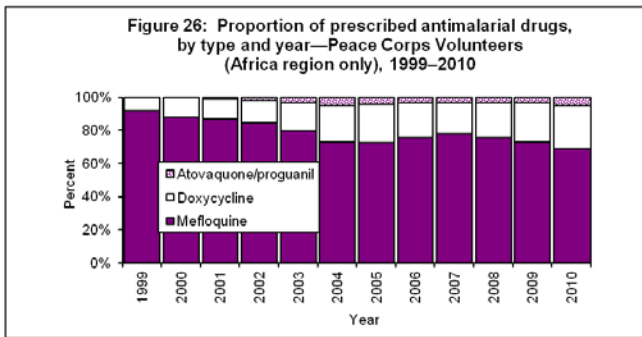

The ESS tracks the number of Volunteers taking long-term antimalarial chemoprophylaxis each month. Short-term use, defined as less than 30 days (e.g., for travel), is not recorded.

The average yearly estimate of all Volunteers on antimalarial chemoprophylaxis in 2010 was similar to 2009 at 58 percent overall (93 percent of Africa Volunteers, 61 percent of IAP Volunteers, and 12 percent of EMA Volunteers).

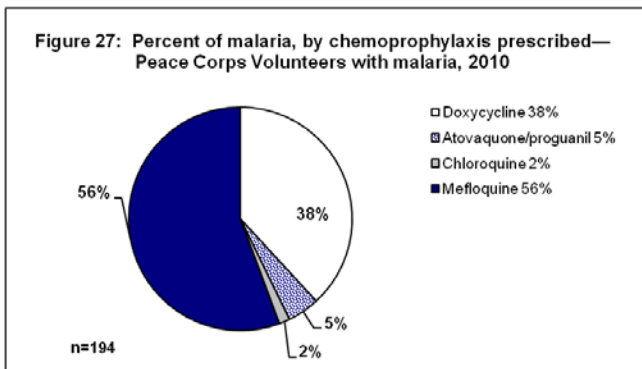

In 2010, 81 percent of Volunteers in malaria endemic countries were on antimalarial chemoprophylaxis: 96 percent of Africa Volunteers, 72 percent of IAP Volunteers, and 42 percent of EMA Volunteers.

Since the average yearly estimate includes both the number of Volunteers and the time they were taking chemoprophylaxis, the average is interpreted using both measures. For example, if 50 percent of Volunteers took chemoprophylaxis for the whole year or if 100 percent of Volunteers took it for half of the year, both instances would produce an average yearly estimate of 50 percent. The average yearly estimate is most accurate if the number of Volunteers in a country remains stable throughout the year.

For Volunteers in the Africa region who took antimalarial chemoprophylaxis, mefloquine was used by 69 percent, doxycycline was used by 26 percent, atovaquone/proguanil (Malarone) was used by 5 percent, and 0.001 percent used minocycline (a variant of doxycycline used to treat acne with the same antimalarial properties).

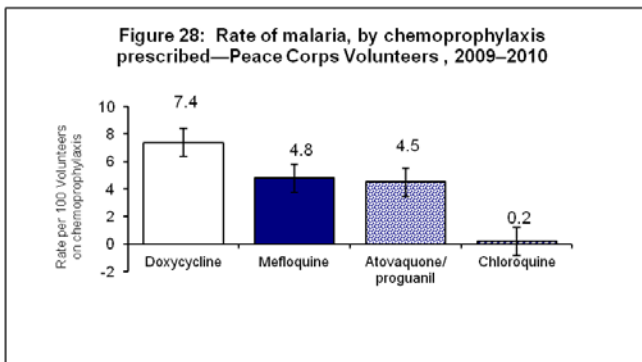

In 2010, among the 194 Volunteers who were diagnosed with malaria, 56 percent were taking mefloquine, 38 percent were taking doxycycline, 5 percent were taking atovaquone/proguanil (Malarone), and 2 percent were taking chloroquine.

Volunteers taking doxycycline, mefloquine, and atovaquone/proguanil (Malarone) had similar rates of malaria, with 7.4, 4.8, and 4.5 per 100 VT years, respectively. The differences between these three rates were not statistically significant, as shown by their overlapping 95 percent confidence intervals.

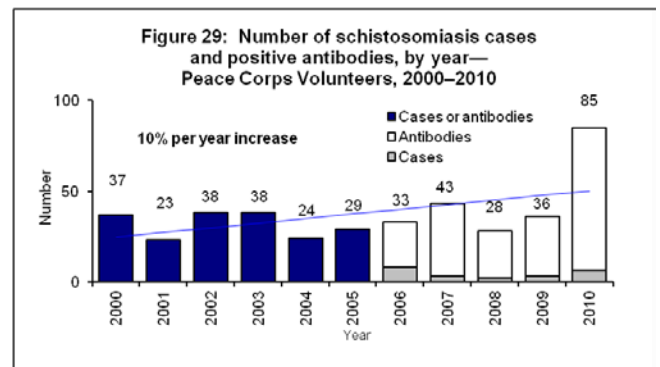

Volunteers on chloroquine had the lowest rate of malaria, 0.2 per 100 VT years. This rate was significantly lower than the rates of malaria among the other three groups.

Schistosomiasis cases and antibodies

Schistosomiasis is a parasitic disease caused by flatworms that penetrate the skin of people who swim or wade in contaminated water. Many schistosomiasis infections are asymptomatic. Acute and chronic infections can produce progressive damage to the bladder, ureters, and kidneys (urinary schistosomiasis), as well as progressive enlargement of the liver and spleen, with intestinal damage and hypertension of the abdominal blood vessels (intestinal schistosomiasis).

In 1998, the Peace Corps instituted universal schistosomiasis antibody screening for Volunteers completing service in endemic areas (described in Technical Guideline 850).

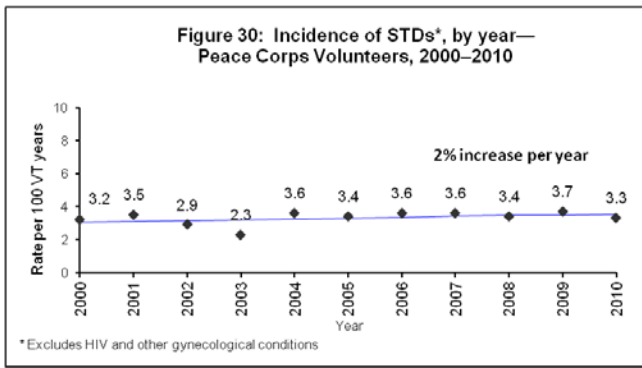

There were six cases of schistosomiasis and 79 positive antibody reports in 2010. Most of the reported cases of schistosomiasis (two cases, 33 percent) and positive antibody reports (21 cases, 26 percent) were from Mozambique.

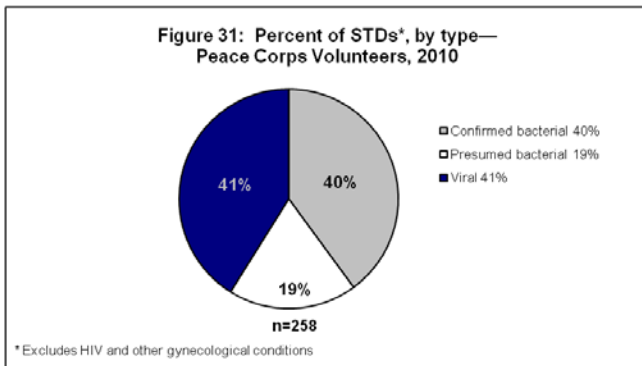

The cases of schistosomiasis among Volunteers have increased by 10 percent per year since 2000. Prior to 2006, schistosomiasis cases and positive antibodies were reported in a combined category.

Sexually transmitted diseases, non-HIV

In 2010, 258 cases of sexually transmitted diseases (STDs) were reported among Volunteers, representing a rate of 3.3 cases per 100 VT years. This rate does not include HIV or the other gynecological conditions reported in the ESS. Since 2000, this rate has increased 2 percent per year.

Forty-one percent (106 cases) of the 258 STDs diagnosed in 2010 were of viral etiology. Fifty-nine percent were of bacterial origin. Viral STDs include genital herpes and human papillomavirus. Bacterial STDs include syphilis, gonorrhea, chlamydia, trichomonas, and chancroid.

An increase in STD rates represents an increase in the risk for HIV infection, certain cancers, heart disease, and infertility among other complications. Individuals with an STD infection are more susceptible to HIV infection. The increase in STD infection among Volunteers signals an opportunity for improved counseling and preventive measures to reduce health risks from intimate behavior.

Tuberculosis

Tuberculosis remains a leading cause of death worldwide. Early detection of infection and preventing active tuberculosis are essential to reducing the mortality risk from this disease. The ideal way to achieve these goals is to establish a screening program.

Either a purified protein derivative (PPD) skin test or an interferon-gamma release assay (IGRA) blood test is used to detect exposure to tuberculosis. IGRA tests are relatively new and are not performed by all laboratories.

If an individual has been exposed to someone with active tuberculosis infection, the PPD skin test or IGRA will be read as positive. A “PPD converter” is a person who has had a negative tuberculosis screening test in the past and now has a positive tuberculosis screening test. PPD converters are at increased risk for developing active tuberculosis and must receive tuberculosis chemoprophylaxis treatment to minimize this risk.

Volunteers are tested for tuberculosis with the PPD skin test during the application process, at close of service, and after any significant exposure.

In 2010, 65 Volunteers were diagnosed with latent tuberculosis by using PPD tests. A 27 percent decrease in tuberculosis skin test conversions among Volunteers was seen from 2009 to 2010 (from 1.1 to 0.8 cases per 100 VT years).

During this period, EMA reported an increase in its PPD conversion rate, from 1.1 to 1.2 cases per 100 VT years (23 cases to 27 cases). Africa saw a decrease of 0.9 to 0.6 cases per 100 VT years (25 to 17 cases). The IAP region reported a decrease in PPD conversion rate, from 1.4 to 0.8 cases per 100 VT years (33 to 21 cases), during the same time period.

The overall average rate of PPD conversions has decreased by 3 percent per year since 2000.

In 2010, there were two cases of active tuberculosis among Volunteers. Since 2000, a total of nine cases of active tuberculosis have been reported. Five of the nine tuberculosis cases were from the Africa region.

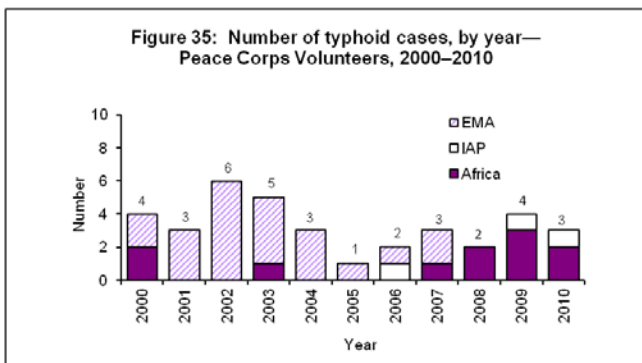

Vaccine-preventable diseases

A vaccine-preventable disease is an infectious disease for which a preventive vaccine exists. In 2010, there were eight cases of vaccine-preventable diseases reported among Volunteers. This involved three cases of Varicella Zoster (two cases of shingles and one case of chicken pox), three cases of typhoid, two cases of pertussis and one case each of diphtheria, meningitis, and an unspecified infection.

In 2010, there were two cases of typhoid among Cameroon Volunteers and one from El Salvador. Since 2000, the Philippines has reported 22 of 36 (61 percent) typhoid cases.

Noninfectious conditions

Alcohol-related problems

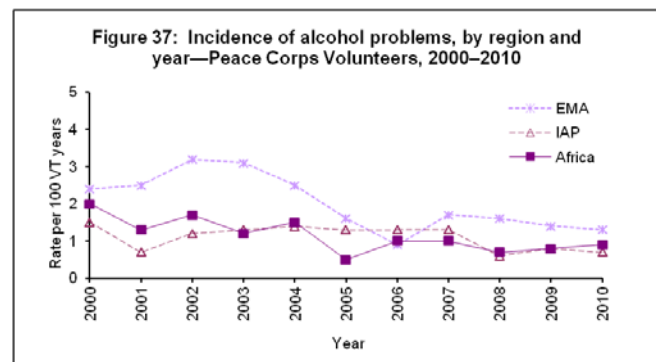

Alcohol-related problems include any incident in which behavior was altered or impaired due to alcohol intoxication. These include incidents observed by staff, Volunteers, or any reliable source.

From 2009 to 2010, the rate of alcohol-related problems among Volunteers decreased from 1.0 to 0.7 cases per 100 VT years. From 2000 to 2002, the rate increased by 2 percent per year. Since 2002, the rate of reported problems has decreased an average of 8 percent per year.

The reduction is likely due to revisions in Peace Corps policy regarding alcohol use and behavioral problems associated with alcohol. It may also be due to changing support practices by PCMOs, in-country and headquarters staff, and improved training methods.

From 2009 to 2010, the rate of alcohol-related problems remained relatively unchanged in the three regions. The rates of reported alcohol-related incidents decreased in the EMA and IAP regions, from 1.4 to 1.3 cases and 0.8 to 0.7 cases per 100 VT years, respectively. There was a slight increase in reported alcohol-related problems in the Africa region, from 0.8 to 0.9 cases per 100 VT years. These changes were not statistically significant.

Asthma

The rate of reported asthma (new asthma and asthma exacerbations) was 3.5 cases per 100 VT years. This rate has increased an average of 4 percent per year since 2000.

From 2009 to 2010, the asthma rate among Volunteers in the IAP region increased by 40 percent, from 2.5 to 3.5 per 100 VT years (60 to 90 cases). Costa Rica, Honduras, Nicaragua, and Paraguay reported significant increases in the number of Volunteers treated for asthma.

During the same period, the Africa region reported a 50 percent decrease in its asthma rate, from 2.0 to 1.0 per 100 VT years (56 to 29 cases.) EMA had no change in cases.

Cardiovascular problems

Cardiovascular problems include conditions related to the heart and blood vessels as determined by the PCMO or another health care professional.

The rate of cardiovascular problems among Volunteers was 0.8 problems per 100 VT years in 2010. This rate has decreased an average of 2 percent per year since 2000.

The Africa region reported a decrease in the rate of cardiovascular problems, from 0.6 to 0.3 treated cases

per 100 VT years (18 to eight cases). This compares to 1.2 cases per 100 VT years (27 cases) in EMA and 0.9 cases per 100 VT years (23 cases) in the IAP region.

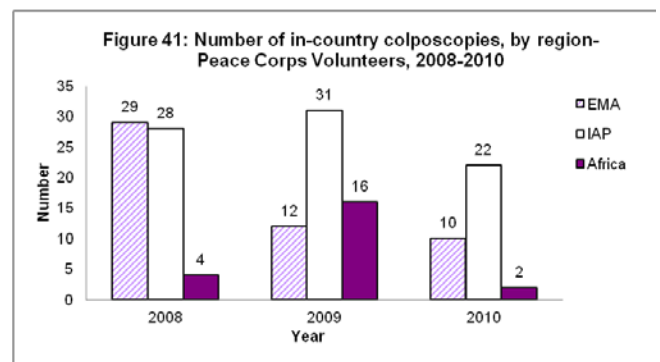

Colposcopies, in-country

Colposcopy is a medical procedure used to diagnose the cause of abnormal pap smears in women. The number of in-country colposcopies performed was tracked for the first time in 2008.

Any colposcopy performed in the Volunteer’s country of service at a clinic, hospital, or facility authorized by medical staff for the diagnosis and/or treatment of a gynecological condition is reported.

Colposcopies performed in another country or region (e.g., Volunteer medevaced to another country for this procedure) are not reported in this category.

A total of 34 colposcopies were performed in 2010. There was a significant decrease in the rate of colposcopies performed in-country from 2009 to 2010, a rate of 0.8 to 0.4 colposcopies per 100 VT years (59 to 34 colposcopies.) The Africa region reported a significant decrease in the rate of in-country colposcopies, from 0.6 to 0.1 procedures per 100 VT years. The decrease in colposcopies occurred mainly in Senegal and was likely due to the temporary suspension in the use of Senegal as a medevac site.

Dental problems

Dental issues include all dental and periodontal conditions evaluated by a dentist or other health care professional. Follow-up visits for a single problem or routine cleanings are not included.

Dental problems are the third most reported condition among Volunteers, with an overall rate of 21.0 problems per 100 VT years in 2010. This rate has decreased by 2 percent per year since 2000.

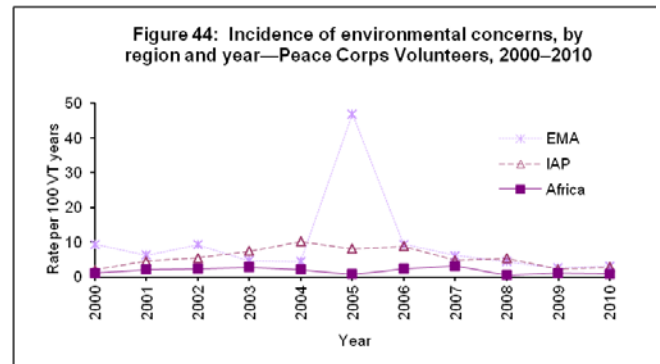

Environmental Concerns

Environmental concerns are one-on-one discussions (in person or by telephone) regarding exposure to environmental threats. Topics may include air pollution, pesticides, food sanitation, natural disasters, and emerging diseases, among others.

There was an increase in the overall rate of reported environmental concerns, from 1.9 concerns per 100 VT years in 2009 to 2.3 concerns per 100 VT years in 2010. During this period, the EMA and IAP regions reported an increase of 2.6 to 3.3 concerns and 2.3 to 2.9 concerns per 100 VT years, respectively. Africa was the only region to post a decrease in the rate of environmental concerns, from 1.1 to 0.9 concerns per 100 VT years. Reports of environmental concerns have decreased an average of 3 percent per year.

Environmental concerns were at a peak in the EMA region in 2005. This was due to anxiety over Avian flu that year.

Injuries, unintentional

Unintentional injuries are reported if they require medical evaluation or treatment by the PCMO or other health care professional.

This category includes pedestrian injuries, bicycle-related injuries, motorcycle-related injuries, motor vehicle-related injuries, water-related injuries, sports-related injuries, and “other” injuries. “Other” injuries include falls, burns, animal bites, poisoning, cuts, abrasions, and puncture wounds not related to sports, water, or vehicles.

The overall unintentional injury rate in 2010 was 15.7 injuries per 100 VT years. This rate is similar to 2009 (15.8 cases per 100 VT years). The highest incidence of unintentional injuries occurred in the EMA region (17.0 cases per 100 VT years), followed by IAP (16.6) and Africa (13.8).

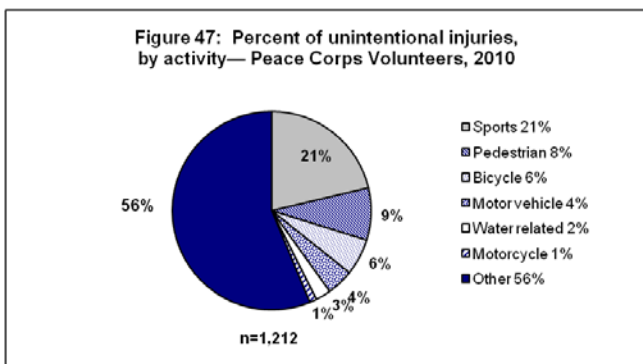

The rate of unintentional injuries increased 3 percent per year from 2000 to 2004 and then decreased 6 percent per year from 2004 to 2010. Decreases in the incidences of motor vehicle-related, sports-related, and other injuries account for the overall decrease seen in this category.

Since 2000, Africa has reported the lowest number of unintentional injuries by region.

Among the 1,212 unintentional injuries reported in 2010, 56 percent were classified in the “other” category. Sports-related injuries accounted for 21 percent of the injuries, pedestrian accidents 8 percent, and bicycle accidents 6 percent. The remainder consisted of motor vehicle accidents (4 percent), water-related accidents (2 percent), and motorcycle accidents (1 percent).

From 2009 to 2010, the rate of pedestrian injuries decreased from 1.5 to 1.3 cases per 100 VT years (107 to 103 cases).

The rate of motorcycle injuries remains low compared to other traffic-related injuries (bicycle, motor vehicle, motorcycle, and pedestrian).

Injuries, Alcohol-related

Injuries, alcohol-related is a category introduced in 2008. Alcohol-related injuries are reported for any injury associated with reported alcohol use by a Volunteer or trainee that requires evaluation and/or treatment by a health care professional.

In 2010, there were 25 cases of reported alcohol-related injuries. The rate of 0.3 cases per 100 VT years is similar to 2009. Fifty-six percent (14 cases) of the alcohol-related injuries came from the Africa region.

Mental health issues

A mental health issue is a one-on-one discussion (in person or by telephone) regarding such factors as depression, problems with interpersonal relationships, reactions to stress, and loneliness.

There was an increase in the number of reported mental health issues in 2010. From 2009 to 2010, the rate of mental health issues increased by 15 percent, from 15.8 to 18.1 issues per 100 VT years (1,142 to 1,399 issues).

EMA was the only region to demonstrate a significant increase in its rate of mental health issues. From 2009 to 2010, the number of reported mental issues increased 24 percent, from 343 to 470 cases (rate of 16.4 to 20.3 issues per 100 VT years). Volunteers in the Kyrgyz Republic and Mongolia experienced the greatest increase in mental health issues seen in the region.

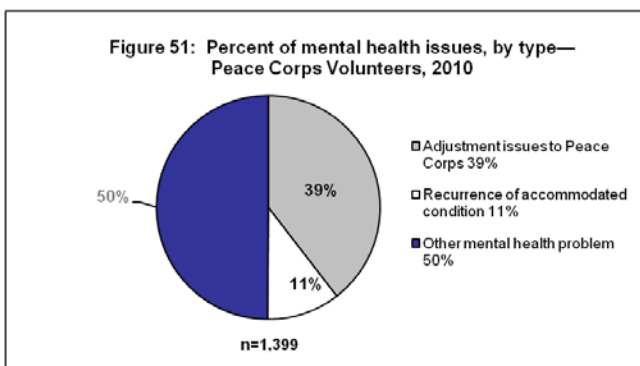

In 2010, there was an increase in violence and political instability throughout the Kryrgyz Republic, which may have contributed to the increase reporting of mental health issues in the EMA region.

The rate of mental health issues increased an average of 1 percent per year from 2000 to 2003 and then decreased 8 percent per year from 2003 to 2010.

The Office of Volunteer Support determines whether an applicant is medically qualified for service and identifies country-specific resources that will allow applicants with conditions requiring accommodation to serve safely and effectively. This is referred to as an accommodated condition.

Among the 1,399 mental health issues reported in 2010, 39 percent (553 cases) were adjustment issue-related conditions, 11 percent (148 cases) were recurrences of accommodated conditions, and the remaining 50 percent (698 cases) were other mental health issues.

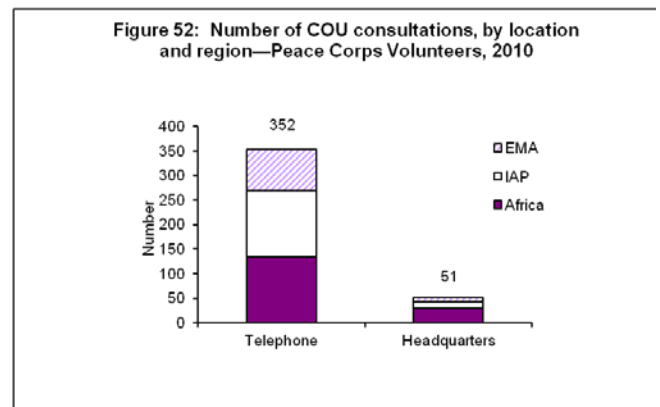

*Counseling and Outreach Unit
Mental health consultations*

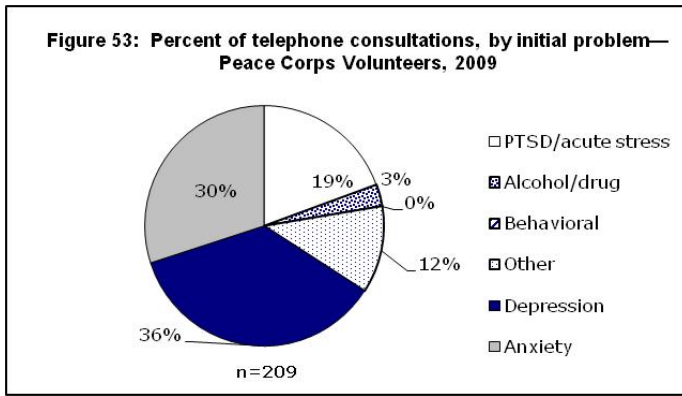

The Counseling and Outreach Unit (COU) maintains records of mental health consultations it provided to Volunteers and trainees. Consultations take place either over the telephone or in person at Peace Corps headquarters (HQ).

Symptoms leading to a consultation may include depression, anxiety, post-traumatic stress disorder (PTSD) or other acute stress, alcohol or drug problems, behavioral problems, or other mental health conditions. Information on COU mental health consultations was first included in *The Health of the Volunteer 2007*.

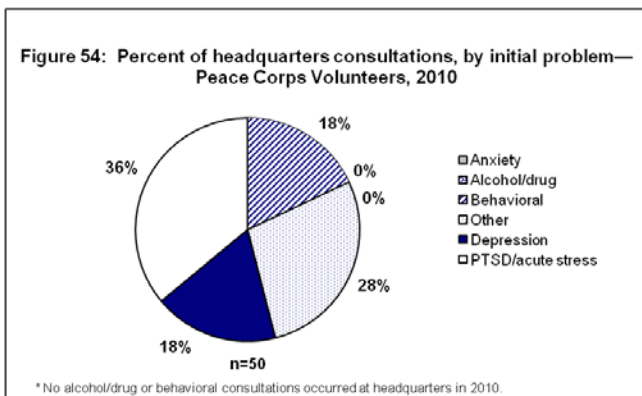

Among the 1,399 mental health problems reported in 2010, there were 352 telephone consultations conducted by COU, accounting for a rate of 4.5 consultations per 100 VT years. There were 51 in-person consultations by COU at Peace Corps headquarters, representing a rate of 0.7 consultations per 100 VT years. Both types of consultations were evenly distributed between EMA (83 phone, seven HQ), IAP (134 phone, 13 HQ), and Africa (135 phone, 31 HQ) regions.

Most of the telephone consultations were for anxiety (132, 38 percent) and depression (78, 22 percent). PTSD and acute stress were responsible for 18 percent (62) of the phone consultations.

The majority of headquarters consultations were for post-traumatic stress disorder (PTSD) or other acute stress (18, 36 percent) and other mental health conditions (14, 28 percent), while anxiety (nine, 18 percent) and depression (nine, 18 percent) were seen less frequently.

New accommodated conditions

New accommodated conditions are accommodations made at post by the PCMO. There were 10 new accommodated conditions reported: four from IAP and three each from EMA and Africa.

Pregnancy

In 2010, there were 28 pregnancies among female Volunteers for a rate of 0.6 pregnancies per 100 female VT years. This rate has decreased an average of 4 percent per year since 2000.

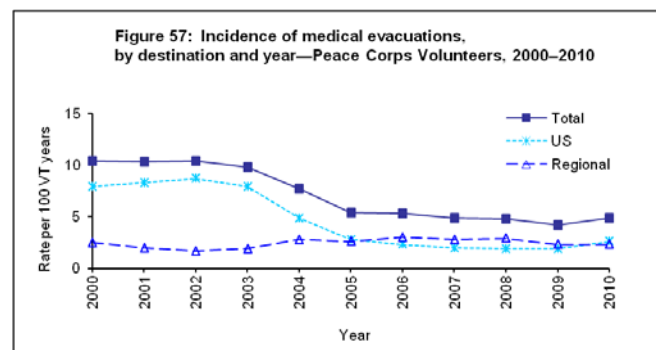

Severe outcomes

Medevacs

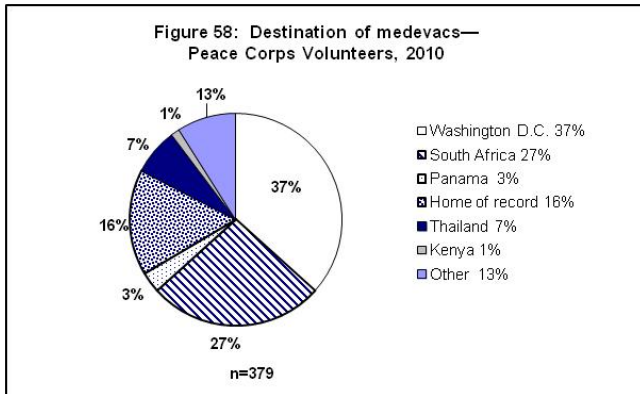

Medical evacuations (medevacs) include all medical evacuations to a third country when a Volunteer’s illness or injury requires evaluation or treatment not available in the Volunteer’s country of service. Volunteers may be medevaced more than once or the same Volunteer may be medevaced to a regional center and then to the U.S. In these instances, each of the medevacs has been counted separately.

The overall medevac rate in 2010 was 4.9 evacuations per 100 VT years. Medevacs to regional centers had a rate of 2.3 evacuations per 100 VT years, while medevacs to the U.S. had a rate of 2.6 evacuations per 100 VT years.

For the first time since 2006, the rate of medevacs to the U.S. was higher than the rate of medevacs to regional centers (2.6 U.S. medevacs to 2.3 regional medevacs per 100 VT years).

Of 379 medevacs in 2010, 53 percent (200 cases) were medevacs to the U.S. (Washington, D.C., Hawaii, or home of record). Regional medevacs comprised 47 percent (179) of all medevacs. Most regional medevacs went to South Africa or other medevac sites, including Australia, Kenya, Panama, the Philippines, and Thailand.

In-country hospitalizations

In 2010, the rate of in-country hospitalizations for Volunteers was 4.8 hospitalizations per 100 VT years. This rate has decreased an average of 3 percent per year since 2000.

The EMA region reported an increase in the rate of in-country hospitalizations since 2009, from 2.4 to 4.0 hospitalized cases per 100 VT years (51 to 93 cases).

This increase was caused by the increase seen in the rate of hospitalizations in the Philippines, from 5.7 to 23.7 cases per 100 VT years (seven to 39 hospitalizations).

In-service deaths

Two Volunteers died while serving in calendar year 2010. A homicide occurred in Lesotho and a Volunteer in Niger died from an unknown cause.

Pre- and Post-service

Pre-service accommodations

The Office of Medical Services assesses all Peace Corps applicants individually to evaluate their physical and mental capacity to perform the essential functions of a Peace Corps Volunteer. With reasonable accommodation, Volunteers must be able to perform these functions without undue disruption due to health problems. OMS determines whether an applicant is medically qualified for Peace Corps service and identifies country-specific resources that will allow applicants with conditions requiring accommodation to serve safely and effectively.

The medical accommodation program within OMS makes decisions regarding applicants with special medical or site-placement needs. The medical pre-service team and/or the medical accommodation coordinator review all applicants who have special medical needs or require special site placement. Applicants with conditions requiring special medical monitoring (i.e., beyond routine care) are cleared by the pre-service team for countrywide service in countries that can support such monitoring. Applicants with conditions that require a specific geographic location or require proximity to an urgent-care medical facility or other care are cleared for site-specific service by the medical accommodation coordinator. This process includes consultation among the OMS and Peace Corps staff at posts.

In 2010, there were 2,116 accommodations, resulting in a rate of 27.4 accommodations per 100 VT years. This rate has been increasing an average of 15 percent per year since 2001.

The most common accommodations in 2010 were psychotropic medication monitoring (8B), with 678 accommodations, and access to mammography services, with 217 accommodations. Volunteers may be accommodated for more than one condition.

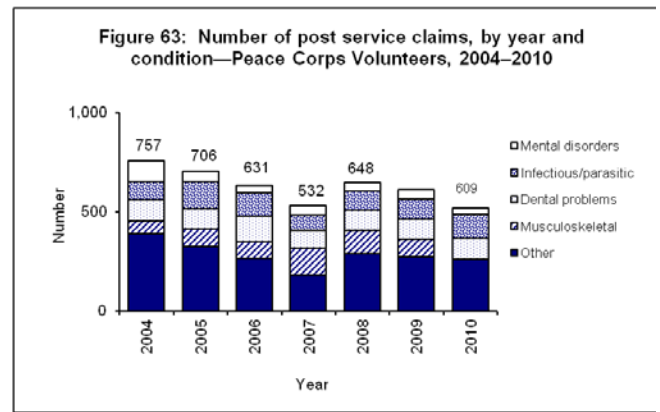

Post-service claims

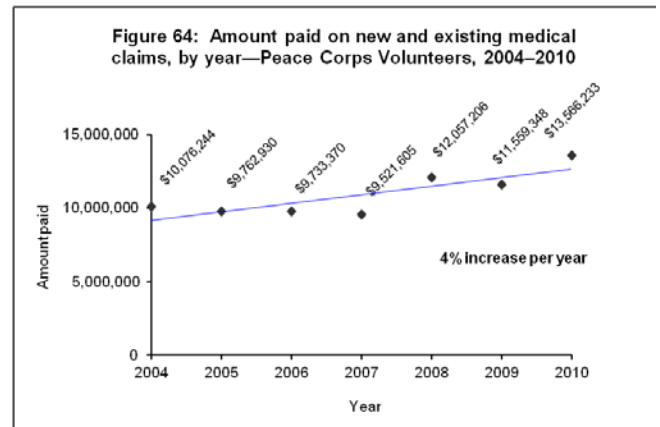

After their close of service, Volunteers have three years in which to file claims under the Federal Employees’ Compensation Act (FECA) for conditions that were caused, accelerated, or exacerbated by their service. Claims are filed with the Peace Corps, adjudicated by the Department of Labor, and paid by the Department of Labor with Peace Corps funds.

In 2010, post-service medical claims were filed by 609 returned Volunteers. As in 2009, the most common claims were for infectious and parasitic diseases (121 claims, 20 percent), dental problems

(103 claims, 17 percent), and diseases of the musculoskeletal system and connective tissue (91 claims, 15 percent). Thirty-one claims were filed for mental disorders (5 percent).

During the 2010 calendar year, the Peace Corps paid \$13,566,233 for Volunteer claims accepted by the Department of Labor. This is based on 2008 dollars. There has been a 4 percent per year increase in payments since 2004.
